

ESD Laminate ground bolt

The WS-4419L ESD Laminate Ground Bolt is machined from a bar of solid brass. It has a 1" diameter countersunk head with a sharply serrated angle featuring 90 teeth that permanently grip the ESD Laminate. The bolt together with an easily applied conductive liquid provides a safe and reliable connection to the ESD Laminate. The ground bolt is 2" long with a heavy duty 3/8 OD shaft, complete with a 3/8-24 nut, washer and star-lock washer to secure installation. An industrial 3/8 ring terminal can be attached to the large shaft or a smaller ring terminal can be connected to the 10-32 screw at the internal threaded base of the bolt shaft. Installation can be done easily from the top of the workstation.

The WS-4419 is 7/8" long and is used mostly by bench top manufacturers because although it requires a countersink from the underneath side of the top, it allows the tops to be easily stacked for shipping.

Both bolts require the WS-4431 carbide countersink for installation.
Must be wired in compliance with standard and facility electrical codes.

Whether you are upgrading your ESD Workstation or purchasing new Workstations, our grounding system's performance and durability is unequalled.
